

Exam Live Food Production

Course teacher: Gilbert Van Stappen

Date: 18 February 2012

Name :

General questions

1. San Francisco Bay (SFB) Artemia and Great Salt Lake (GSL) Artemia are both the same species. Which one ?

Nevertheless, they have quite different characteristics (that are important for aquaculture). Name a few of these differences.

3. Natural plankton is of the course the best food for fish and shrimp larvae. But its use is not cost-effective. So aquaculturists are using a limited number of live food organisms. Not every type of organism is suitable for use as live food in aquaculture. There are a number of conditions, both from the side of the farmer, and from the side of the fish/shrimp larvae eating the live food.

Name of few of these conditions
